Memo

To: Beth Kendall, Director,
Budget & Financial Planning

From: Martin A. Orlowski, Director,
Institutional Planning & Analysis

Subject: Enrollment Trend Analysis

Date: October 3, 1996

Based on your request the Office of Institutional Planning & Analysis has analyzed end of session enrollment for the past ten years. The attached study employs a moving mean statistic in relation to actual enrollment. The model used in this study uses past enrollment to predict future enrollment.

If you have any questions with regard to this study, please do not hesitate to call Sue Cheng or myself at 7746. We hope that this report will provide you with the information you need for your work with the College Budget Council.

Attachment: Enrollment Trend Analysis

Oakland Community College
Enrollment Trend Analysis

Methodology

Implicit in trend oriented data are fluctuations over time. These fluctuations may be natural variations or an abnormality caused by an outside force. To accurately determine if an enrollment shift from one year to the next indicates increase or decline, actual enrollment data, moving mean, standard deviation, and predicted range are summarized in this study. Data are based on end of session enrollment for all four terms at each campus and college-wide.

Definitions

Moving mean: Statistic calculated by looking at three year intervals and taking the average of that interval.
Standard deviation of the moving mean: Represents the range above or below the moving mean within which values must lie in order to be considered normal variation.
Predicted range: Calculated by adding and subtracting one standard deviation from the moving mean.

If enrollment falls on the moving mean, the data is considered static for that time period. When enrollment is not on the moving mean *(trend line)* yet falls within the predicted range this indicates normal enrollment fluctuation. Enrollment that falls outside the predicted range are aberrations, unexplained by normal fluctuations. These aberrations may be due to an exceedingly high or low enrollment year, or be caused by a condition not immediately identifiable (high school graduation rates, college marketing efforts, employment/unemployment rate, competition, etc.).

Analysis

College-Wide

Oakland Community College has experienced remarkable enrollment decreases since Fall 1993. Enrollment figures have either reached or fallen below the low end of the expected range for the past three years. Although small gains were shown in the Spring and Summer of 1995, the number of student credit hours dropped back down in subsequent terms.

Campus

Auburn Hills and Highland Lakes have undergone enrollment declines similar to the College-Wide trends. However, Orchard Ridge has experienced enrollment losses for each term starting with Fall 1992. On the other hand, Royal Oak and Southfield enrollment remained relatively steady for the past six years.

Prediction

For the past seven years, both college-wide and campus enrollment have either fallen into or been very close to the expected range. Especially, over the last three years, student enrollment has been at the low end of the range. Assuming no major aberration takes place, OCC enrollment history suggests enrollment for the coming year will fall on or below the low point of the range. It is important to note that the this prediction is only based on past enrollment. Other factors, which may impact OCC enrollment, are not examined in this study.
